

AMENDMENTS TO THE ABSTRACT:

Please amend the abstract to read as follows:

31

A method for manufacturing liquid discharge heads head is provided with discharge ports for discharging liquid, liquid flow paths communicated with the discharge ports for supplying liquid to the discharge ports, a substrate having heat generating members for creating bubbles in the liquid, and movable members facing the heat generating members, each and being arranged in each the liquid flow paths. ~~having the~~ The movable members have a free end on the discharge port side with a specific gap with respect to the heat generating members. ~~This method comprises the steps of forming the boundary layer used for providing a gap between the~~ The movable member and is fixed to the substrate above the heat generating member on the substrate, ~~of laminating the movable member on the boundary layer so as to position the free end above the heat generating member, at the same time fixing the movable member on the substrate, and of forming the gap between the movable member and the heat generating member by use of the boundary layer.~~ With the structure thus arranged, there is no need for the step to position the movable member with the substrate, and also, the movable portion of the movable member is separated from the substrate after the movable member is formed on the substrate and incorporated in the liquid discharge head so as to implement
